

Project Design Phase Proposed Solution Template

Date	24 July 2026
Team ID	Individual / Solo Project
Project Name	Software Installation Request Automation
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employees today request software installations through email or informal messages to IT. This leads to delays, no visibility into request status, inconsistent or missing manager approvals, and a real risk of installing unlicensed or non-compliant software.
2	Idea / Solution description	A standardized Service Catalog item in ServiceNow lets an employee request licensed software directly. The request is automatically routed to the manager for approval, checked against license availability and compliance rules, and then fulfilled by IT — with the employee notified at each stage, end to end, without manual coordination.
3	Novelty / Uniqueness	Combines self-service catalog ordering with real-time license and compliance checking and automated remote fulfillment in a single workflow, instead of treating requesting, approving, licensing, and installing as separate manual steps handled over email.
4	Social Impact / Customer Satisfaction	Employees get software faster and can track request status themselves instead of chasing IT. Reduced back-and-forth lowers frustration for both employees and IT staff, and consistent approval and license tracking reduces compliance risk for the organization.
5	Business Model (Revenue Model)	As an internal IT solution, the return comes from efficiency: fewer manual hours per request, faster employee onboarding, and avoided costs from over-licensing or compliance penalties. Packaged as a reusable ServiceNow app, it could also be distributed via the ServiceNow Store under a per-seat or subscription licensing model.
6	Scalability of the Solution	Built on ServiceNow's multi-instance cloud platform, the catalog and workflow scale to any number of software titles, employees, and departments across regions. Because the workflow is configuration-driven, it can extend to new approval chains, geographies, or additional IT asset types without re-architecting the solution.
