

Software installation request

SCENARIO	Journey Map															
An employee discovers, requests, gets approval for, and receives installation of licensed software through the Service Catalog	Entice		Enter		Engage							Exit		Extend		
	How does an employee become aware they can request software this way?		What happens as the employee begins the request process?		In the core moments of the process, what happens?							What happens as the request is fulfilled and closed?		What happens after the software is installed?		
Steps What does the employee typically experience?	IT onboarding & policy awareness New hires learn during onboarding that software must be requested through IT rather than installed directly.	Discovering the Service Catalog An employee learns about the Service Catalog from a colleague, IT communication, or the company intranet.	Log into ServiceNow portal The employee opens the Employee Service Portal and signs in with single sign-on.	Navigate to the Software category The employee browses the Service Catalog and locates the Software category among many others.	Search or browse for the software The employee searches by name or browses a list of approved, licensed software titles.	View software details & license info The employee opens the catalog item to see a description, license type, cost, and whether approval is required.	Submit installation request The employee fills out a request form with business justification and device details, then submits.	Manager approval The request routes automatically to the employee's manager for sign-off before it proceeds.	License & compliance check Software Asset Management checks whether a license is available and the request stays within compliance limits.	IT fulfillment & installation IT pushes the software to the employee's device remotely, or a technician installs it if remote push isn't possible.	Completion notification Once installation finishes, an automated notification tells the employee the software is ready to use.	Verify installation & close ticket The employee checks that the software works, and the ticket is closed in ServiceNow.	Satisfaction survey A short survey asks the employee to rate their experience with the request process.	Software appears in asset inventory The installed software is logged automatically in the configuration management database tied to the employee's device.	License renewal & compliance tracking As the license nears expiration, the system tracks renewal status and compliance automatically.	Personalized software recommendations Based on role and department, the catalog surfaces other tools the employee may find useful.
Interactions Who do they talk to? What tools or systems are involved?	New-hire onboarding session, IT policy page on the intranet, HR onboarding checklist	Company intranet homepage, IT Service Portal tile, colleague recommendation	SSO login screen, ServiceNow Employee Portal	Service Catalog homepage, category tiles	Catalog search bar, category and department filters	Catalog item detail page (description, license type, cost, approval required)	Request form (justification, device ID), Submit button, order confirmation	Approval notification by email or Teams, manager approves or rejects in ServiceNow	Software Asset Management module, license pool, compliance rules engine	IT support technician, remote deployment tool, employee's device	Automated email or Teams notification, ticket status update	ServiceNow ticket, employee confirmation prompt	Post-fulfillment CSAT survey, email or in-portal prompt	CMDB, Software Asset Management dashboard	Automated renewal reminders, Software Asset Management module	Service Catalog recommendations, IT communications
Goals & motivations At each step, what is the employee's primary goal? ("Help me...")	Help me understand how to get the software I need	Help me find where to request software	Help me get into the system quickly and securely	Help me find the software section without hassle	Help me find the exact software I need	Help me understand if this fits my needs and what approval it needs	Help me complete the request quickly and correctly	Help me get quick sign-off from my manager	Help me avoid license or compliance issues	Help me get the software installed with minimal disruption to my day	Help me know my software is ready to use	Help me confirm everything works before the ticket closes	Help me share quick feedback on my experience	Help IT track what's installed on my device for support and audits	Help me keep using the software without unexpected interruption	Help me discover other tools that could help in my role
Positive moments What steps feel easy, fast, or reassuring?	Clear onboarding materials build confidence in the process	Portal is easy to find from the company intranet homepage	Single sign-on makes login seamless	Clear category tiles make navigation intuitive	Search returns relevant results quickly	Clear descriptions help the employee decide quickly	A short form with pre-filled employee data feels effortless	Automated approval routing speeds decisions up	Automated checks prevent accidental over-licensing	Remote installation requires no effort from the employee	A prompt notification confirms the request is complete	A quick confirmation step closes the loop cleanly	A one-click rating takes almost no effort	Centralized visibility helps with future troubleshooting	Proactive renewal reminders prevent unexpected loss of access	Relevant suggestions save time discovering new tools
Negative moments What steps feel frustrating, confusing, or slow?	Policy details are buried in long onboarding documents and easy to miss	Some employees don't know the catalog exists and email IT instead	Password or MFA issues occasionally cause delays	Catalog has many categories, making the software section hard to spot	Some software isn't listed, or duplicate items cause confusion	Missing license or cost information creates uncertainty	Long forms with unclear required fields cause frustration and errors	Requests sit pending when a manager is unavailable or out of office	A depleted license pool blocks the request with no clear next step	Installation is delayed when the fulfillment queue backs up	Notification doesn't always confirm the install actually succeeded	Tickets sometimes auto-close before the employee confirms it actually works	Survey fatigue leads to low response rates	Inventory data can go stale if devices aren't rescanned regularly	Employees are sometimes caught off guard when a license lapses	Irrelevant recommendations feel like noise and get ignored
Areas of opportunity How might we make each step better?	Add a direct Service Catalog link inside onboarding emails and chat	Promote the catalog through periodic Slack/Teams announcements	Surface a quick self-service password reset link on the login screen	Add a persistent search bar with autocomplete across the catalog homepage	Maintain a single, curated, regularly-updated software catalog list	Show live license availability and an estimated approval time on the page	Auto-populate employee and device details from the CMDB	Add automatic delegation or escalation after a set number of days	Auto-notify procurement to buy more licenses when a pool runs low	Enable silent, self-service install for standard pre-approved software	Add a quick employee confirmation step that verifies the software opens	Require a one-click employee sign-off before the ticket auto-closes	Shorten the survey to a single tap rating with an optional comment	Automate periodic re-discovery scans to keep inventory accurate	Notify employees and managers before expiration with a one-click renewal request	Use role and department data to tailor which tools are suggested
